INTRODUCTION

Akdağ Natural National Park, settled on Sandıklı county in Afyon province and Çivril county in Denizli province, is a transition area between Central Anatolian and Aegian regions. Akdağ is approximately 2000 m in elevation and bears both forest and steppe characteristics. There is no previous work encountered related to the insect fauna of the study field. However, few species from the studies on Afyon, Kütahya and Denizli provinces, which was thought to be related with the

study field, are included in the insect faunistic list. Lodos et al. (1978) [1], Hüseyinoğlu (1999) [2] and "The Key to Anatolia-Afyon"-(Butterflies part) by Hüseyinoğlu (2004) [3] are the dealt studies in this concept.

MATERIAL AND METHOD

Insect samples were collected during April-September 2004. Insect net and light trap were used in collecting insects. The samples were processed with standard methods and added to the collection. The species which were collected by others from National park and its surroundings are given in the species list with 'Lit' abbreviation. The study which Afyon Governorship have it made is so important for this research. In this study named The Key of

Anatolia-Afyon (2004) [3], dear Ass. Prof. Yusuf Hüseyinoğlu made a research on butterflies and stated that Afyon is rich in species diversity and have over 120 butterfly species. The species of which the photographs were given in this study and also determined by us are given with the 'Lit' abbreviation referred to the mentioned study. The author was consulted for other species. The author, who collected butterflies but not published them, shared his identified butterfly material with us. Author material's species together with the ones we had identified are indicated by (*) sign. The species that we couldn't determine but stated before by Hüseyinoğlu are given without any special sign and with collecting place data.

Each group of those samples were identified by the specialists. Both the personal collections (Neşe Çağatay-Lygaeidae, Selim S. Çağlar-different families of Hemiptera) were examined and identified or they were asked to be identified. Besides, many sources [4-9] were searched thoroughly and common species were identified. The names of the specialists and the groups they identified are as follows: Bruchidae (Coleoptera) by Y. Orhan Mergen; Carabidae by Neslihan Kocatepe, Cerambycidae and Chrysomelidae by Hüseyin Özdikmen and Tuncay Türkeş, Apidae (Hymenoptera) by A. Murat Aytekin, Formicidae by E. Elif Aydın Dede, Megachilidae by Yasemin Güler, Lepidoptera, by Selma Seven Çalışkan, Odonata by Ali Demirsoy and Yusuf Durmuş, Orthoptera by Ali Demirsoy and Hasan Sevgili.

RESULTS AND DISCUSSION

In the Akdağ Natural National Park specimens in various groups of insects were collected. 152 different species in 45 families have been determined. The taxonomic conditions and ordo levels have been presented in Table 1.

At the end of this study, 152 species could have been identified. This study comprises a 30 days field trip and this short time period limited the determined species number. With a rough observation, it could be understood that most areas of the study field includes much higher number of species. Karanlık Stream, Tokalı Canyon, Karabel Hillsides and Akkale Hill could be counted as an example. Detailed exploration of these areas would undoubtedly enable a certain evaluation. According to IUCN [5] *Parnassius mnemosyne*, known as Clouded Apollo, from Karabel Hillsides and *Zerynthia cerisyi* from Tokalı Canyon, which are determined with this study, take place in the endangered species category. Besides, one of the species mentioned in the The Key of Anatolia-Afyon (2004) is *Parnassius apollo*, the Apollo butterfly. It was stated that this species is found on Sultan Mountains and also known as one of the endangered species in IUCN category. *Parnassius apollo* was not encountered in the National Park borders but there are suitable habitats having an elevation of 1500 m and higher that this species would have lived. The areas where these species found are important and need to be protected.

ACKNOWLEDGEMENT

We would like to thank Research Assistant Senem Özdemir and Research Assistant Burcu Şabanoğlu for their efforts in preparing the insects for collectional purposes, Ass. Prof. Dr. Orhan Mergen (Bruchidae), Ass. Prof. Dr. Hüseyin Özdikmen (Cerambycidae and Chrysomelidae), Assoc. Prof. Dr. A. Murat Aytekin (Apidae), Dr. Yasemin Güler (Megachilidae), Assoc. Dr. Hasan Sevgili (Orthoptera), Bachelor student Esra Ada (Odonata), Research Assistant Neslihan Kocatepe (Carabidae) and Research Assistant E. Elif Aydın Dede (Formicidae) for identification of families given in paranthesis, Prof. Dr. Neşe Çağatay and Prof. Dr.
